

# NowAlerts

## An Instant Messaging and Presence Server (IMPS) solution

Getting people **NOW!!**

This has always been a problem. However, with NowAlerts you can manage the contacting of people in many different ways. From a desktop console you can see who is available at a particular time and connect to mobile phone users immediately.

Software is able to set up automatic alerts via email, HTTP or other software applications.

The service uses the IMPS protocol available on many new mobile phones. The client on the desktop, of which there can be many, is able to see which phones are currently logged on and communicate via their Instant Messaging client immediately. So, for example, the system will display to hospital administrators/operation managers which on-call doctors are available in an emergency and whether they are contactable. The system communicates immediately with the required party and operators will get an immediate response back

### Possible Applications

- Hospitals
- Event Management
- Emergency Services
- Security Services
- Social Services
- Health Organisations
- Clubs / Groups
- Universities
